

THE FREE PLAYBOOK

The Nasdaq Killzone Playbook

The exact session windows, liquidity logic, and entry checklist I use to trade NDX100 during the New York killzone — built for traders who are tired of guessing.

Why most traders lose in the wrong hours

The market does not move randomly across the day. Liquidity pools, institutional orders, and the highest-probability moves cluster into specific time windows. Trade outside them and you are fighting low volume, fake moves, and chop. The killzones are when the real money shows up.

■ What a "killzone" actually is

A killzone is a defined time window where institutional order flow concentrates — where **liquidity gets engineered, swept, and reversed**. For Nasdaq (NDX100), the windows that matter are tied to London and New York. Inside them, the algorithm seeks liquidity above old highs or below old lows, then delivers price toward the real target.

■ The model behind every setup

Everything in this playbook runs on one cycle: **Accumulation → Manipulation → Distribution** (AMD), also called the Power of 3. Price builds a range, runs the stops of impatient traders (the manipulation / "judas swing"), then moves in the true direction. Your job is not to predict — it is to wait for the sweep, confirm the shift, and execute.

The one-line version

Liquidity gets taken, structure shifts, you enter on the return to an imbalance — only inside a killzone. Outside those hours, you sit on your hands.

READ THIS TWICE

90% of beginners blow accounts not because their analysis is wrong — but because they take the right setup at the **wrong time**, with the **wrong size**. Time and risk beat indicators.

THE THREE KILLZONES

When to actually be at the screen

All times below are New York time (EST/EDT) — the reference clock for Nasdaq. If your timezone differs, convert once and save it. The New York AM killzone is the highest priority for NDX100; treat the others as context.

London Open KZ

02:00 – 05:00 NY

Sets the early liquidity grab and daily bias. Often runs Asian highs/lows. Useful for direction, not always for NDX entries.

New York AM KZ ★

08:30 – 11:00 NY

The prime window for Nasdaq. Cash open at 09:30 brings volume, the judas swing, and the cleanest sweep-and-reverse setups. This is where you focus.

NY PM / Lunch caution

11:30 – 13:00 NY

Low-volume chop. Most fakeouts live here. Default to no-trade unless a clean PM setup forms after 13:30.

■ The bias filter (do this before the open)

Before 09:30, mark: the **previous day's high and low**, the **Asian range** high/low, and any obvious **equal highs/lows** (resting liquidity). These are the magnets. Price will usually run one of them inside the killzone before the real move. You are waiting for that run.

Rule of thumb

No sweep of a liquidity level = no trade. If price hasn't taken out a clear high or low, there's nothing to fade. Patience is the edge.

THE ENTRY MODEL

The 5-step killzone entry

This is the same sequence behind the NDX100 and US30 breakdowns on the page. Run every setup through all five. If a step fails, there is no trade — and that is a win.

01 Liquidity sweep

Inside the killzone, wait for price to run a marked level — previous day high/low, Asian high/low, or equal highs/lows. The stops get taken. This is the manipulation leg.

02 Market structure shift (CHoCH / BOS)

After the sweep, drop to a lower timeframe (5m / 1m). You want a clean break of structure **against** the sweep direction — the first sign the algorithm has turned.

03 Find the imbalance (FVG / OB)

Mark the fair value gap or order block left behind by the impulsive move. This is your entry zone — where price is likely to return before continuing.

04 Entry on the return

Enter as price retraces into the FVG/OB. Stop goes beyond the sweep extreme. **Define risk before you click** — never after.

05 Target the opposing liquidity

Your target is the next pool of liquidity — the opposite high/low the market is reaching for. Aim for a minimum **1:3 risk-to-reward**. Partial, trail, done.

STICK THIS ON YOUR SCREEN

The pre-trade checklist

Do not enter unless every box is checked. Screenshot this page. The discipline is the system.

- ☐ Am I inside a **killzone**? (NY AM is priority)
- ☐ Have I marked my **liquidity levels** before the open?
- ☐ Has price **swept** a clear high or low?
- ☐ Did I get a **structure shift** (CHoCH/BOS) after the sweep?
- ☐ Is there a clean **FVG or order block** to enter from?
- ☐ Is my **risk per trade** $\leq 1\%$ of the account?
- ☐ Is the trade at least **1:3 RR** to the next liquidity?
- ☐ Am I trading the plan — **not** revenge, FOMO, or boredom?

■ The risk rules that keep you alive

Risk a fixed % per trade (1% is standard). Cap your daily loss — two losers and you're done for the day. The goal of the killzone model is not to be right often; it's to lose small and win big. One clean 1:3 covers three losses.

THE 3 NUMBERS BEFORE EVERY TRADE

Entry. Stop. Target. If you can't say all three out loud before you click, you don't have a trade — you have a gamble.

YOU HAVE THE MAP

This is the **foundation**. The full system is the **edge**.

This playbook gives you the windows and the entry model. Inside the FXDarwish course, you get the live execution, the full liquidity curriculum, and the psychology that makes it repeatable — the same process behind every breakdown you've watched.

- The complete ICT/SMC curriculum across 10 phases — risk, execution, technical mastery, and psychology
- Live New York session execution — real entries, real exits, narrated start to finish
- Weekly market outlook on Gold, Indices and Nasdaq, plus the private community
